Abstract

Does the USA have a system for healthcare delivery? If so, who designed it? Who modulates it? What are the goals of the healthcare delivery system? Does it produce high value for patients, or for others in the system? What are the domains in the healthcare system? Do they interact with each other for the purpose of accomplishing the six aims set forth by the National Academy of Medicine: patient-centered; efficient; effective; timely; equitable; and safe? What vision and goals would you desire from our delivery system? Would the stakeholders come together to optimize the output of the delivery system to accomplish your vision and goals, or would they come together to maximize the value for their own domain? How would you perturbate the current system to get the stakeholders to self-organize and work toward your vision and goals? We will discuss these topics in the seminar.
